Multi-Generation Register 2003
A description of contents and quality

I serien Bakgrundsfakta presenteras bakgrundsmaterial till den statistik och de prognoser som avdelningen för befolknings- och välfärdsstatistik vid SCB producerar. Det kan röra sig om produktbeskrivningar, metodredovisningar samt olika sammanställningar som kan ge en överblick och underlätta användandet av statistiken.

Annex 3: Example of a personal record

1. Objectives and background

The Multi-Generation Register is today made up of persons who have been registered in Sweden at some time since 1961 and those who were born in 1932 or later. These are called index persons. The Register contains information on index persons and their biological parents. For index persons who were adopted, there is also information on their adoptive parents.

The Multi-Generation Register is a part of the register system for the Total Population Register. The data comes from the national registration records kept by the National Tax Board. From the 2002 version onwards, data on biological parents has even been collected for certain index persons from older national registration materials and Statistics Sweden's register of births.

A new version of the register is put together in March every year. The first version of the Multi-Generation Register was produced in March 2000 to replace the so-called Second Generation Register, kept by Statistics Sweden from 1994 to 1999.

Some changes and events in national registration, among other things, which have had an effect on the production of the register are briefly described below.

1947	1961	1968	1991	1997/98	2000	2002	2003
Personal reg. numbers	TPR		New organisation for national registration	Base retrieval/ New TPR	Suppl. base retrieval	Develop. of Multi-gen	New version

1947:

Civic registration numbers were introduced at the same time as personal records were established for all persons who were registered in a parish register in Sweden in 1947. If a person was 15 or younger in 1947, their parents were recorded in their personal record. This means that parental information mainly exists for those persons born in 1932 or later.

The work to establish personal records for all the persons who were registered in 1947 was carried out during 1947 and 1948. This means that parental information can be missing for index persons born in 1932 or 1933, because these persons were over 15 when their personal records were established.

Between 1947 and 30 June 1991, personal records have been established for all persons born in Sweden or who had immigrated to Sweden.

1961:

To be included in the Multi-Generation Register, index persons must have been registered at some time since 1961. 1961 is the starting point because, before this year, there was essentially no population register in ADP (automatic data processing) format.

1968:

At the same time as sections of the national register were computerised in 1967, Statistics Sweden established a register for the nationally registered population in Sweden. The register was called the Total Population Register (TPR). In 1969, Statistics Sweden put together a TPR for the first time with the reference date of 31 December 1968. The TPR was thereafter updated with amendment reports (notifications) received from the national register. These notifications were based on reports from the parish civil registration office, which acted as the local authority for the national register.

In the computerised national register, information on biological or adoptive parents was not included.

1991:

A restructuring of the national register was carried out on 1 July 1991. The restructuring meant that national registration at local level was moved from the parish office to the local tax office.

In conjunction with this restructuring, the National Tax Board computerised all personal records for persons who were registered on 30 June 1991. Personal records for persons deceased between 1947 to 30 June 1991 were not computerised. For persons who had emigrated during this period, the National Tax Board computerised the personal records for those persons born in 1920 or later.

The restructuring also involved an entirely new ADP system for national registration. The new system, comprising of registration and storage of data, included a certain amount of new information, for example data on parents and children.

1997/1998:

Also in conjunction with the restructuring of the national register in 1991, a new notification system, with partly new contents, came into operation at the National Tax Board. On 1 November 1997, Statistics Sweden made a base retrieval from the national register of the National Tax Board which consisted of all the then-registered persons in Sweden. This base retrieval then formed the basis for the new notification system. The changes in notification routines required a total reorganisation of the TPR system. The new TPR system came into operation at the end of 1997 / beginning of 1998. For more information, see Background facts in population and welfare statistics 2002:2 A new system for the Total Population Register - More possibilities and better quality.

2000:

To make up for shortfalls in the data on family relations, which were not included in the original base retrieval from 1997, a special supplementary data retrieval was done at the beginning of 2000. The retrieval concerned data on the biological parents of persons who were either deceased or had emigrated. In addition, a child's relationship to a person other than the parent or guardian was also included. After a government decision, information

regarding cancelled adoptions with links between the child and adoptive parent were also included.

2002:

A study was already carried out in 2001 which looked at the development of the Multi-Generation Register. During the first half of 2002, different tests were done to identify the best procedure for the supplementary work. During the second half of the year, all personal records for persons born from 1932 to 1967, who died during the period from 1947 to 1967, began to be computerised and registered on microfiche 1947-1967. This data is used to supplement the variables for which information is missing in the existing Multi-Generation Register. It was also investigated during 2002 whether Statistics Sweden's registers could be used in this supplementary work.

2003:

In March 2003, a new version of the Multi-Generation Register was produced, containing supplementary data from the hitherto computerised personal records and data from Statistics Sweden's register of births. See Background facts on Population and Welfare Statistics 2003:5 "Multi-Generation Register 2002 - A description of contents and quality".

2. Areas of application

The link between children and biological parents can be used for various purposes, such as medical studies in which the kinship between different individuals plays a crucial role. Information on adoption can be used in various types of social research. There are routines to identify the relationship of persons to the index person, e.g. parents, siblings (full or half), children and cousins. After relatives have been identified, information on the individuals can be taken from a different register at Statistics Sweden or another authority.

3. Production of the Multi-Generation Register

3.1 Production from the Total Population Register system

The Multi-Generation Register is produced anew from the TPR system once a year.

3.1.1 Collection of index persons

The index persons and their country of birth are taken from three different sections of the TPR system: Registered persons, Deceased persons and Emigrated persons. The section Registered persons consists of all the nationally registered persons in Sweden. Persons appearing in both the Registered persons and Deceased persons sections are counted as living persons. Persons appearing in both the Registered persons and in the Emigrated persons sections are taken out. Persons who appear in both the

Deceased persons section and in the Emigrated persons section are also taken out.

Persons with an incorrect date of birth or a registration number that is wrong in some other way are taken out.

3.1.2 Identification of biological father and mother

The biological mother and father of index persons are taken from the TPR system, which identifies the relationship between mother and child and between father and child.

At the same time as the Multi-Generation Register is created from the TPR system, logical controls and adjustments according to a rule system are carried out. For a more detailed description of the rule system, see section 7.1.3 Regulations.

3.1.3 Adoptions

Information on adoptive mother and father are taken from the TPR. Persons with conflicting relationships are taken out. For foreign-born persons, information on immigration is retrieved and used to estimate adoption year if this is missing up to 1991. Adoptions for around 140 persons have resulted in the person being adopted by a second adoptive mother and/or adoptive father. These terminated adoptions are put in a separate register.

3.2 Development of Multi-Generation Register

The development of the Multi-Generation Register is of great importance for medical research. The register is already unique in the world and it is possible to develop it further from the national register's source material.

Since 1999, there has been an ongoing discussion with the Karolinska Institute about the possibilities to make additions and expand the Multi-Generation Register. Additions relate to supplementary information on variables for which information is missing in the existing register. Expansion of the register would mean that the current register population would be increased with further index persons born before 1932 or registered before 1961.

For the moment, work with adding supplementary data has been prioritised over expansion in the development of the Multi-Generation Register.

During 2002, work started with adding supplementary data to the register. It is most relevant to add the registration numbers of biological parents, but even the variable country of birth for both parents and index persons will be added wherever possible.

The work to add supplementary data is concentrated on index persons deceased before 1 July 1991. This delimitation has been set because all the personal records of persons registered up to 30 June 1991 were computerised

when national registration was moved from the parish offices to the National Tax Board 1991. Furthermore, personal records for persons born in 1920 or later who emigrated between 1947 and 30 June 1991, are also computerised. This means that parental information is missing for a large number of index persons who died between 1961 and 30 June 1991, because the records of the deceased persons would not have been computerised.

By adding data on deceased persons, the aim is that the share of index persons with year of death 1961-1990 with parental information should rise to the same level as those with year of death 1991 or later (see diagram 3A).

The development of the Multi-Generation Register involves a long period of extensive work. In order to be able to link index persons and their parents, the following sources are used:

- Personal records
- Statistics Sweden's register of births

Below is a short description of the work to add supplementary data, using personal records and the register.

3.2.1 Personal records

Before 1 July 1991, personal records with information on population were kept in the national registration system at the parish office (see annex 3). Personal records include links between children and parents. They were established for all persons who were registered in Sweden in 1947. After 1947, a personal record was established for every person who was born or who immigrated up to 30 June 1991. The moving of national registration materials to Sweden's nine regional archive offices is currently underway. So that personal records can be used, it is necessary that the material is transferred to microfiche or digitalised. Transferral to microfiche/scanning is being carried out at the same time as the move. It is estimated that all parish books will be delivered to the regional archives by 2015. Exception is made for personal records of persons deceased before 1968. These personal records have already been delivered to the respective regional archive but they have not been transferred to microfiche/scanned.

The current work to add supplementary data from the personal records is focused on persons who died between 1961 and 1967 and those who were born during the period from 1932 to 1967. Apart from the relationships between deceased index persons and their parents, relationships between the deceased and their children are also identified. This means that, where data is missing on the biological parents in the Multi-Generation Register, information on deceased children will also be added.

Personal records for persons deceased between 1947 and 1960 will also be computerised. These persons are not included in the population of the Multi-Generation Register but there may be information in their personal records which can be linked to an index person already existing in the register. Data

from personal records for persons deceased between 1947 and 1960 are saved for use in an eventual expansion of the population.

Transferral to microfiche/scanning and computer registration of personal records is being carried out by the research centre SVAR (Swedish Archive Information) in Ramsele, Sweden. The work began during 2002 and it is estimated that it will continue until 31 December 2004. This means that each new annual version of the Multi-Generation Register created until 2005, will include more information regarding deceased index persons.

The latest version of the Multi-Generation Register, created in March 2004, includes data from personal records which were computerised up to week 6 in 2004. In Annex 1, Table 10 shows the number of computerised personal records, by county.

When the material comes to Statistics Sweden, logical controls and adjustments according to a rule system are carried out. For a more detailed description of the rule system, see section 7.1.3 Regulations.

3.2.2 Statistics Sweden's registers

The supplementary work from the registers includes Statistics Sweden's register of births. This register includes information on the parents of persons born during the period 1961 to 1997. The supplementary work from the registers mainly involves index persons deceased between 1968 and 1991, and those born between 1961 and 1991.

In nearly all cases, there is information on the biological mother and, when the mother is married at the time of the child's birth, even information on the husband if, at the time of birth, he is understood to be the father.

The supplementary work from Statistics Sweden's register of births was carried out when the Multi-Generation Register 2002 was created.

Statistics Sweden's register of births undergoes logical controls and adjustments according to a rule system. For a more detailed description of the rule system, see section 7.1.3 Regulations.

3.3 Production of the Multi-Generation Register 2003

Information from the TPR system on index persons and their parents is collected in a register called Multi-GenTPR. Information from personal records on persons and their relatives are found in a register called Pakt. Regarding Statistics Sweden's register of births, relationships are recorded in a register called Births.

All three registers undergo logical controls so that they are all structured in the same way. This has resulted in three different registers with an identical presentation of variables and identical regulations for the creation of variables. For a more detailed description of the rule system, see section 7.1.3 Regulations.

The three registers include changes to registration numbers that have been reported up to 1 March 2004.

The next step in the production is to combine the above mentioned three registers into one new Multi-Generation Register, which includes supplementary data from both the personal records and the Statistics Sweden register of births. Together with this, a fixed priority order is used to choose which sources should be applied.

The sources are prioritised in the following order:

1. Total Population Register
2. Personal records
3. Statistics Sweden's register of births

Data is taken from the sources in this priority order when producing the Multi-Generation Register. The data is only taken from a lower priority source if it is missing in the higher priority source.

The TPR is the determining information source because the data comes from the national register of the National Tax Board. Data from the TPR has the highest priority. For example, the TPR could have data on the date of birth of an index person's mother but the mother's registration number could be missing. If the personal records or the Statistics Sweden register of births contain the mother's registration number but have a different date of birth from that in the TPR, this registration number is not used in the Multi-Generation Register. In this case, no additional data can be added from the personal records or the register of births.

A special source code has been developed to identify which source the data has come from. The source code is shown for the following variables: index person's country of birth, biological parents' registration numbers and date of birth, and biological parents' countries of birth.

For country of birth, another source is also used, the Population and Housing Census (PHC). As a last resort, the country of birth is taken from the 1960 and 1970 PHC for those index persons and parents for which data on country of birth is still missing after additions have been made from the personal records and register of births.

A simplified flow chart showing the production of the new version is shown in Figure 1.

Figure 1: Simplified flow of how the Multi-Generation Register is produced

4. Planned changes in future versions

Each new annual version of the Multi-Generation Register produced until 2005 will contain further additions of data of deceased index persons. The data is taken from personal records and, in particular, concerns index persons born from 1932 to 1967 and those who died during the period from 1961 to 1967.

A study is underway to look at the possibilities of adding index persons born from 1932 to 1944 who died during the period from 1968 to 1991 and for whom the data on parents is missing.

With the combination of the three different registers, there are persons in the personal records and in Statistics Sweden's register of births that fulfil the conditions to be index persons but that do not appear in the TPR system. Why these are not included as index persons will be investigated further. These persons will not be added as new index persons in this version of the Multi-Generation Register.

Regarding adopted index persons, no additional information on adoptive parents will be added in this version of the Multi-Generation Register. In material from personal records, only a few adoptions have been found. These will be studied further and the addition of information regarding adoptive parents will possibly be carried out at the same time as the computerisation of personal records.

An investigation on re-used registration numbers is underway at Statistics Sweden. The suggestions from the investigation can influence future versions regarding the treatment of re-used registration numbers. See section 7.1.3 Regulations

5. Results from the 2003 version

5.1 Biological relationships

The number of index persons with information on their parents' registration numbers differs between different subpopulations (see table 1).

Table 1: Number of index persons with registration number for mother and father

Index persons	Share with registration number for mother (%)	Share with registration number for father (%)
Born in Sweden	97	95
Born in Sweden in 1950 or later	99	98
Foreign-born	27	23
Born in Sweden, deceased 1961-2003	77	66
Foreign-born, deceased 1961-2003	18	13
All	85	83

Compared to the version produced in 2003, the number of deceased index persons with data on parents has increased. This is the result of work to add data from personal records. In the subpopulation "born in Sweden and deceased 1961-2003", the share of index persons with data on mother has increased by 1 percentage point compared to the 2002 Multi-Generation Register. The corresponding increase of index persons with data on father is 2 percentage points.

The number of foreign-born index persons deceased between 1961-2003 with data on parents has increased by 2 percentage points.

Figure 1. Share of index persons with data on parents

Whether data on parents is available for foreign-born index persons depends on the age at which the person came to Sweden, and if they came alone or together with their parents.

Information on parents for foreign-born persons is missing if they were older than 18 when they immigrated. The share of foreign-born persons with information on parents falls after 1990, due to the greater number of children adopted abroad (whose biological parents are not in Sweden). In this year's version, adopted persons make up 10% of foreign-born persons in 1990 and for the youngest, i.e. those born in 2002, 24% of all immigrated children are adopted.

In figure 2, the link between age when immigrated and the existence of data on parents is illustrated.

Figure 2. Number of index persons with data on none, one or both parents, by age when immigrated

5.1.1 Deceased persons

The supplementary work for the Multi-Generation Register is concentrated on deceased index persons. These deceased index persons make an interesting group from a research point-of-view.

Figure 3A shows how the share of deceased index persons with information on parents has increased as a result of the supplementary work carried out from the personal records and Statistics Sweden's register of births. The supplementary work is divided into following two parts.

1. Addition of index persons born from 1961 to 1991, who died from 1968 to 1991. Source: Statistics Sweden's register of births
2. Addition of index persons born from 1932 to 1967, who died from 1961 to 1967. Source: Personal records

At the same time as the 2002 Multi-Generation Register was created, supplementary work, part 1, has been carried out. For the population described in part 2, additions from personal records will be completed for the first time with the creation of the Multi-Generation Register in 2005.

In this version, index persons who died between 1961 and 1967 have also been added from Statistics Sweden's register of births wherever possible. This information will be replaced by the computerised data from the personal records for every new version of the Multi-Generation Register created, because data from personal records has a higher priority.

Figure 3A reports the number of deceased index persons, born in Sweden, with information on parents **before and after additions** from personal records and Statistics Sweden's register of births.

**Figure 3A: Deceased persons 1961-2003, born in Sweden
Number with information on parents, before and after additions**

In figure 3A, it is clearly shown that the number of index persons with information on parents increases for those who have died after 1991. This is because the national registration system was restructured on 1 July 1991, and, at the same time, all personal records for those registered by 1 July 1991 were computerised. For those index persons who died in 1980 or later, certain basic data was included when the National Tax Board carried out its basic data input, at the same time as the restructuring of the national register. This explains why there is a larger number of index persons with information on parents who died in 1980 or later.

Tables 12A and 12B in appendix 1 show the results of the additions from personal records and Statistics Sweden's register of births for index persons who died between 1961 and 2003.

Compared to the Multi-Generation Register 2002, the share of deceased index persons with data on parents has increased for those who died between 1961 and 1967 (see figure 3B). This is as a result of additions made from the personal records.

**Figure 3B: Deceased persons 1961-2003, born in Sweden
Share with information on parents, 2003 version compared to 2002 version**

For index persons for which information on parents is missing, it is possible to take data from the Population and Housing Census on what is called Population & Housing Census parents. It should be noted that the biological relationships between children and parents in the Population and Housing Census are not guaranteed. For more information on Population & Housing Census parents, see section 9.2.1 "Population & Housing Census parents".

5.1.2 Results of supplementary work

In total, around 40 000 personal records have been used in the supplementary work for this version of the Multi-Generation Register. Information from personal records has generated around 58 000 new details.

Table 2 shows the number of details, divided by respective source. In total, the Multi-Generation Register contains slightly over 9 million index persons.

Table 2: Number of details by source

Variables	Source					Details missing
	TPR	Pakt	Births	PHC		
Country of birth-index person	8 943 148	5 991	15 362	1 037	106 992	
Country of birth-father	7 327 584	10 215	.	19 017	1 715 714

Registration number-father	7 468 331	8 648	13 988	.	1 581 563	
Registration number-mother	7 720 818	7 675	12 805	.	1 331 232	
Total	54 547 739	58 548	70 342	31 748	8 799 333	

From Statistics Sweden's register of births, slightly over 70 000 details have been added. Additions to the register from Statistics Sweden's register of births mainly concern index persons who died between 1968 and 1991, and those who were born between 1961 and 1991. In this year's version of the Multi-Generation Register, even index persons who died between 1961 and 1967 have been added wherever possible. Slightly over 30 000 details on country of birth have been taken from the Population & Housing Census.

In total, slightly over 30 500 index persons have been updated with information on mother's and/or father's registration number through additions from the personal records and Statistics Sweden's register of births. Of these, 10 400 index persons have only been updated with information on the parents' registration numbers from the personal records. Correspondingly, 20 100 index persons have been updated with their parents' registration number only from Statistics Sweden's register of births.

Statistics are shown below on how the information in the Multi-Generation Register 2003 is broken down for index persons.

Number of index persons with all information	7 255 054
of which - all information taken from TPR	7 212 779
- all information taken from personal records	1 997
Number of index persons missing some information	69 706

Because Statistics Sweden's register of births does not include information on father's country of birth, there are no index persons who have all their information taken from this register.

5.2 Adoptions

In this case, "adopted" relates to persons with at least one adoptive parent.

There are slightly over 140 000 adopted index persons. Of these adopted index persons, slightly over 63% were born in Sweden. From 1971 onwards, foreign-born index persons are a majority among adopted persons.

Figure 4. Number of adopted index persons, by country of birth and year of birth

Information on the time of the adoption is available from 1991 onwards. For foreign-born persons, the year of adoption can be estimated with the help of information on the first year of immigration.

In appendix 2, tables 13 - 15, there is information on adopted persons and adoptive parents.

6. Contents

6.1 Statistical measures

6.1.1 Objects and population

To be included in the Multi-Generation Register 2003, index persons must be born between 1 January 1932 and 31 December 2003. In addition, index persons must have been registered in Sweden at some point between 1 January 1961 and 31 December 2003. These index persons make up the target population.

There are slightly over 9 million index persons in the Multi-Generation Register. Those with information on adoptive mother and/or adoptive father amount to around 140 000.

Figure 5 illustrates the population of the Multi-Generation Register in the form of a Lexis diagram. Lexis diagrams are used to illustrate the link between age and year of birth.

Figure 5. Target population in the Multi-Generation Register

6.1.2 Variables

The Multi-Generation Register contains the following variables:

- Registration number of index person
- Sex of index person
- Country of birth of index person
- Registration number of biological father
- Date of birth of biological father
- Country of birth of biological father
- Registration number of biological mother
- Date of birth of biological mother
- Country of birth of biological mother
- Source code of country of birth of index person
- Source code of registration number of biological father
- Source code of date of birth of biological father
- Source code of country of birth of biological father
- Source code of registration number of biological mother
- Source code of date of birth of biological mother
- Source code of country of birth of biological mother
- Child's position in mother's family
- Number of child's position in father's family
- Number of children - mother
- Number of children - father
- Registration number of adoptive father
- Date of birth of adoptive father
- Name of country of birth of adoptive father
- Registration number of adoptive mother
- Date of birth of adoptive mother
- Name of country of birth of adoptive mother
- Date of immigration
- Date of adoption - adoptive father
- Date when adoption ended - adoptive father
- Date of adoption - adoptive mother
- Date when adoption ended - adoptive mother
- Mark for re-used registration number - index person
- Mark for re-used registration number - biological father
- Mark for re-used registration number - biological mother

A registration number is a uniform indication of identity for physical persons. The registration number in its current form was introduced in 1967 but a system with date of birth and a three-digit birth number had already been used since 1947. The control digit, which was introduced in 1967, is calculated automatically from the date of birth (six digits) and a birth number (three digits) plus a fourth digit added to the birth number (control digit). The control digit is calculated using the "modulus-10" method.

For the information on a parent's registration number to appear, the parent must have been registered at some point since 1947 when registration numbers were introduced.

Sex can be seen from the third digit in the birth number included as part of the registration number.

Date of birth is made up of year, month and day. For parents, date of birth information can exist without a complete registration number. For example, parents who were never registered in Sweden can have date of birth information. Parents who have been registered in Sweden can also only have date of birth information, for example if the parents died or emigrated before 1947. There are also cases in which the four last digits are not correct in the registration number but the date of birth can still be established.

Country of birth shows the country of birth's name and refers to the situation at the time of birth. Until 1947, all persons born abroad were counted as foreign-born. Since 1947, children born abroad are not registered as foreign-born if their mother is registered in Sweden at the time of birth.

Children born in Sweden with a unregistered mother (a refugee) can have Sweden as the country of birth. This applied up to 1997.

Paternity is established in the national register in the following way: if the mother is married or recently widowed at the time of the child's birth, the husband is seen to be the father of the child. In other cases, paternity is normally established by acknowledgement or, in certain cases, by a court and is then reported later, not at the time of birth.

A **source code** indicates whether the data is taken from the TPR, personal records or Statistics Sweden's register of births. For the index persons' or parents' country of birth, the data can even have the Housing & Population Census as source code.

The **child's position in family** shows the child's ordinal position among biological children in the register for the biological mother and father. The variable is derived.

For index persons with parents born in Sweden in 1915 or later, information on the position in the family is of a good standard, i.e. as long as all siblings in the family are included as index persons in the register. It should be taken into account that all siblings who have not been registered from 1961 onwards are missing completely and that, for siblings who have died between 1961 and 1997, information on parents is missing. With the supplementary work to add index persons who died between 1961 and 1967, information on parents will exist for more persons. If the parents were born before 1910, the Multi-Generation Register should not be used to derive siblings.

For index persons with foreign-born parents, the position in the family is of a worse standard. Index persons who immigrated as adults are missing

information on the relationship with parents and position in the family. However, index persons who immigrated before they were 18 or who were born in Sweden often have information on parents and position in the family. These means that information on siblings can be derived. In this case, the register only includes siblings who were registered from 1961 onwards in Sweden and who, at the time of immigration, were younger than 18 or who were born in Sweden.

When using the child's position in the family or deriving siblings for index persons with foreign-born parents, it should always be taken into consideration that the material being used has larger possibilities for error than material relating to index persons with parents born in Sweden. If parents are under 20 years when they immigrate, the data should have a high level of accuracy.

Number of children refers to the number of biological children in the register for mother and father. The variable is derived. For more information, see the comments relating to the variable "Child's position in family".

Date of immigration relates to the date when foreign-born adopted index persons immigrated to Sweden.

The **date** when the adoption started and possibly ended for adoptive mother and adoptive father mainly exists from 1991 onwards.

Mark for re-used registration number is provided for those registration numbers which are suspected to be re-used. For a more detailed explanation, see section 7.1.3 Regulations.

7. Reliability

7.1 Unreliable sources

7.1.1 Coverage

In terms of index persons, the Multi-Generation Register covers, for the most part, all persons who have been registered since 1968. For those who were only registered between 1961 and 1967, coverage is good but not as comprehensive. A lesser number of persons, around 2 800, of those who emigrated between 1961 and 1967 and who did not return, are missing in the register.

7.1.2 Processing

The data in the Multi-Generation Register comes from three sources: the TPR, personal records and Statistics Sweden's register of births.

TPR: Data registration is carried out by National Tax Board. At the same time as the data is registered, certain checks and amendments are made. When notifications come to Statistics Sweden, a large part of the data is also

checked before it is input into the TPR. Errors which are noticed when the TPR is updated should be sent back to the national registration office for investigation and amendment.

Personal records: Personal records were established by the parish offices in 1947. After this, a personal record was established for every person who was born or immigrated to Sweden until 30 June 1991. Transfer to microfiche and data registration is carried out by SVAR (Swedish Archive Information) in Ramsele, Sweden. Checks are carried out at the same time as the registration. Further logical checks are carried out when the registered material is delivered to Statistics Sweden. Errors are reported back to SVAR for investigation and amendment.

Statistics Sweden's register of births: Between 1961 and 1967, all received information on births was coded and registered at Statistics Sweden. Data taken from the "plåtregister", or sheet register, kept by the county offices for registration. Prints from the sheet register were sent to Statistics Sweden where they were checked and coded. The data was then transferred to a magnetic tape.

7.1.3 Regulations

Attention is paid to known changes to registration numbers. This means that an individual should only appear once as an index person. Every individual (index person and parents) appears with the last known registration number.

In the TPR system, there are around 4 000 registration numbers which are suspected to be re-used. This is particularly the case for registration numbers of deceased persons. After a person has died, their registration number is re-used so that another person, who has perhaps immigrated, has been allocated the deceased person's registration number. This means that the parental links in this case will be unreliable. The registration number is suspected to have been re-used in cases when the person has a date of death but is still registered after this date. The database for allocated registration numbers at the National Tax Board has so far only contained registration numbers that have been used and allocated since 1980. Registration numbers of persons who died before 1980 could therefore be allocated to persons who have immigrated and who have the same year and date of birth. Certain number series have also run out, where dates of birth such as 1 January and 1 July are overrepresented among persons who have immigrated, verified by the identity documents they brought with them. So that these problems can be eliminated from the Multi-Generation Register, the following rule is used: if an index person has a suspected re-used registration number, all data has been deleted apart from the registration number and sex. If a parent has a re-used registration number, their country of birth has been deleted. A mark has also been added to the register to indicate that the registration number is suspected to be re-used. Table 6 in appendix 1 shows the number of suspected re-used registrations numbers, by year of birth of the index person.

In the national registration, there are gaps which lead to some index persons lacking all data on mother and father in the Multi-Generation Register. The

text below describes the regulations which apply to create the Multi-Generation Register and which rules apply for the TPR, personal records and Statistics Sweden's register of births.

Rules applying to the TPR, personal records and Statistics Sweden's register of births:

- Fathers with an incomplete date of birth or an unreasonable age are taken out. Fathers that are younger than 14 years or older than 80 years are considered to be of unreasonable age.
- Mothers with an incomplete date of birth or an unreasonable age are taken out. Mothers that are younger than 13 years or older than 60 years are considered of unreasonable age.

Rules applying to the TPR:

- For persons who have several differing details on mother and father, the registered mother/father is chosen ahead of the unregistered mother/father. Doubles of mother/father where both are registered or unregistered, and can therefore not be chosen, are taken out.
- Information on parents' country of birth is taken from the Registered persons section in the TPR system. If information on county of birth is present, the country of birth is written in as Sweden. For parents without information on country of birth in the Registered persons section, the country of birth can be taken from the Deceased and Emigrated sections of the TPR system. The following rules apply for country of birth in the TPR system. A person has Sweden as country of birth if they:
 - are born in Sweden and the mother and father are registered in Sweden and are the guardians
 - are born abroad of a mother who is registered in Sweden.

In the Multi-Generation Register, children who are born in Sweden of an unregistered mother also have Sweden as their country of birth. When immigrating, these children are then registered as born in Sweden.

- Adoptive parents with an incomplete date of birth or otherwise invalid registration number are taken out.
- When there is information on several adoptive mothers or adoptive fathers, the registered ones are chosen over the unregistered.

The following rules apply for personal records:

- Registration numbers in personal records only consist of the date of birth and a three-digit birth number. This is because the fourth and last digit in the registration number, i.e. the control digit, was first introduced in 1967. Because the personal records relate to those

persons who were registered between 1961 and 1967, Statistics Sweden calculates the control digit in the registration number, using the modulus-10 method. In this way, the registration numbers in the personal records are adapted to how the registration numbers were formatted after 1967. When the registration number already has a control digit, it is possible to check that the date of birth and the three-digit birth number are correct. This is not possible if Statistics Sweden has itself calculated the control digit.

- It can occur that there is only a date of birth in the information from the personal records, i.e. no correct registration number. The information can be used once supplemented with the parents' date of birth.
- The personal records also contain the country of birth in the form of the county of birth, for those born in Sweden. For those born abroad, the country of birth is written clearly. County of birth has been adapted according to the TPR system and it is interpreted that the country of birth is Sweden. Countries of birth which are clear in the personal records have also been adapted according to the TPR system rules.
- Information from personal records undergoes logical controls. Below are some examples of the controls which are carried out on the material:
 - date of birth <= date of death
 - date of emigration > date of birth
 - date of emigration < date of death
 - information on sex registered from the personal records and is controlled through a calculation from the registration number

The rules applying to Statistics Sweden's register of births:

- The fourth and final digit in the registration number, i.e. the control digit, was introduced in 1967. The control digit in the registration number for persons born from 1961 to 1967, and who are in the Statistics Sweden register of births, is calculated using the module-10 method. In this way, all registration numbers taken from the register of births are adapted to how registration numbers were formatted after 1967. When the registration number already has a control digit, it is possible to check that the date of birth and the three-digit birth number are correct. This is not possible if Statistics Sweden has itself calculated the control digit.
- In the register of births, there is a code for the mother's county of birth. If there is information on the mother's county of birth, the country of birth of the mother is written as Sweden. There is no information in the register of births on the father's county or country of birth.

8. Timeliness

8.1. Frequency

The Multi-Generation Register is produced annually.

8.2 Production time

The production time for the Multi-Generation Register is approximately 3 weeks.

8.3 Punctuality

There is no official date for when the register should be ready. Versions of the register from earlier years have been ready for use during March each year.

9. Comparability and coherence

9.1 Comparability over time

The Multi-Generation Register was put together for the first time in 2000 and contained national registration data until 31 December 1999. Since then, an annual register has been produced and, since the production of Multi-Generation Register 2002, information from the TPR is supplemented with information from personal records and from Statistics Sweden's register of births. Information in the Multi-Generation Register depends on the definitions and rules which are used in each system. See section 7.1.3 Regulations

In addition to the rules which are used when putting together the Multi-Generation Register, there are a number of events which had a strong impact on national registration and therefore also on the Multi-Generation Register. These events are described in section 1.1 Objectives and Background.

The number of index persons increases for each year of the register. Newborn persons and immigrants contribute to this increase; newborn persons by increasing the number of index persons born during the previous year, and immigrants by increasing the numbers in general.

During a lifetime, the same person can have the need to change registration number. When the Multi-Generation Register is put together, attention is paid to these changed registration numbers. For persons changing registration number, it is possible to show all registration numbers. In the register, persons appear with their last known registration number.

9.2 Coherence with other statistics

The Multi-Generation Register is primarily intended for research and therefore coherence with other registers is, in many cases, essential. The

register is used, for example, in medical studies where kinship is of key importance. An example of registers in which background information and result data can be taken for the study populations are the Population and Housing Census, the Cancer Register of the National Board of Health and Welfare or other medical registers.

Use with other registers is only possible after clearance for release from the respective authority in each specific case.

9.2.1 Population & Housing Census parents

The Population and Housing Censuses from 1960-1990 contain data on which persons belong to the same household dwelling, i.e. that live in the same dwelling. From these data on household situation and civil status, information on PHC parents and PHC children can be derived. *It should be noted that relationships in the PHC are not confirmed, which means that no biological relationship between children/siblings and parents can be recorded.*

A PHC parent is the adult man or woman who belongs to the same household dwelling as the child. The data are derived using the following variables: household situation, civil status and age. The definition of a PHC parent/sibling differs somewhat between the annual versions of the PHC.

Information on a PHC parent can be used where appropriate, i.e. in studies on heritage versus environment.

Figure 6 shows the number of deceased index persons, born in Sweden, with information on PHC parents from the census between 1960-1990.

**Figure 6: Deceased persons 1961-2003, born in Sweden
Share with information on PHC parents, 1960-1990**

Definitions in Population & Housing Census 1960 – Population & Housing Census 1970

PHC parents

A PHC parent is the person in charge of the property or spouse to the person in charge. The person in charge of the property is the person who is renting, who owns or, in some other way, is responsible for the entire property. In existing marriages, the man is generally considered the person in charge of the property.

If the household situation is not known, civil status is used to create the PHC parent. A person should be married, a widow / widower or divorced in order to be counted as a PHC parent.

PHC sibling (children)

The person should be the child of the person in charge of the property and / or their spouse and should be unmarried. The person can also be related to the person in charge of the property and/or their spouse in another way and be 17 years of age or younger and unmarried.

Grandchildren

The person should be the grandchild of the persons in charge of the property and/or their spouse and be unmarried. If there are more than one grandchild, a PHC sibling is created for this.

Definitions in Population & Housing Census 75

PHC parents

A PHC parent is the household owner or the person who is married or living with the property owner. The term property owner refers to the person among the inhabitants that rents, owns or in some other way is in charge of the property.

If the household situation is not known, civil status is used to create the PHC parent. A person should be married, a widow / widower or divorced in order to be counted as a PHC parent.

PHC sibling (children)

The person should be the child of the property owner and/or the person who is married or living with the property owner and should be unmarried. The person can also be any other inhabitant of the household who is aged 17 or younger and unmarried.

Definitions in Population & Housing Census 1980 – Population & Housing Census 1990

PHC parents

The PHC parent is a reference person in the household or the person married or living with the reference person. The term reference person refers to the person who in the individuals questionnaire is noted as married or living

together. In the PHC 85 and the PHC 90, the oldest person among those noted as married or living together has been selected as the reference person. Both men and women are reference persons in the PHC 80. In a household without persons who are married or living together, the oldest person in the household has been selected as the reference person.

If the household situation is not known, civil status is used to create the PHC parent. A person should be married, a widow / widower or divorced in order to be counted as a PHC parent.

PHC sibling (children)

The person should be a child to someone in the household and be unmarried. The person can also be any other person living in the household who is aged 17 or younger and unmarried.

10. Availability and clarity

10.1 Documentation

The work with the production and development of the Multi-Generation Register has resulted in the following published reports.

- Background facts on population and welfare statistics 2001:5, Multi-Generation Register, Annika Skarle
- Background facts on population and welfare statistics 2001:6, Study on the supplementary work and expansion of the Multi-Generation Register, Beatrice Kalnins, et. al.
- Background facts on population and welfare statistics 2002:1, Supplementary work on the Multi-Generation Register, results from test registration of personal records of deceased persons 1947-1967, Beatrice Kalnins
- Multi-Generation Register 2002, a short description of version 2002 in brochure format
- Background facts on population and welfare statistics 2003:5
” Multi-Generation Register 2002 – A description of contents and quality , Beatrice Kalnins et al.

- ”Multi-Generation Register 2003, a short description of version 2003 in brochure format

10.2 Confidentiality and rules for handling personal information

Unidentifiable individual information from the Multi-Generation Register can be requested for research and statistical purposes. Every request to Statistics Sweden on the release of individual information undergoes a confidentiality test. Statistics Sweden is subject to statistical confidentiality rules which can be found in Chapter 9 § 4 of the Secrecy Act (1980:100). For

the automatic handling of personal information, the rules in the Personal Data Act (1998:204) also apply.

10.2.1 Secrecy Act

According to Chapter 9 § 4 of the Secrecy Act (1980:100), confidentiality applies in specific activities of authorities that involve the production of statistics on data showing individual personal or economic situations and, which can be identified as belonging to that individual. The principal rule is therefore that data in statistical activities are secret and should not be given out. Exceptions to this rule have been made for information needed for research or statistical purposes, which cannot be directly linked to the individual through name, other identity symbol or comparable situation. In these cases, information can be given out, if it is clear that it can be revealed without the persons concerned or connected to the information being in any way harmed or injured. The term individual relates to physical as well as legal persons.

Before any information is issued under one of the exceptions, a judgement must always be made on the risk for harm or injury to the persons concerned by or connected with the information. It should be clear that the release of information can be done without risk.

10.2.2 Personal Data Act

The Personal Data Act (1998:204) contains certain fundamental decisions on the handling of personal information; among others, that the handling should be legal and carried out in the correct manner and according to best practice. The information which is handled should be adequate and relevant. The information should be handled only if it is essential to the objectives of the activity.

Special rigorous rules apply for the handling of sensitive personal information, i.e. information on race or ethnic background, political views, religious or philosophical convictions, trade union membership and health or sexual circumstances. The handling of sensitive personal information for research purposes is allowed after explicit consent from the registered person. It is allowed even without such consent, if it is essential and approved by a research ethics committee or is recorded in advance to the Data Inspection Board, for advance control.

In the Official Statistics Ordinance (2001:100), there are specific rules outlining the extent to which sensitive information can be handled in the production of official statistics within the different statistical areas. Sensitive information, which can be handled for the production of official statistics, can also be used for other statistics and research. According to the Personal Data Act, sensitive personal information can always be handled with the explicit consent from the registered person.

10.2.3 Longitudinal databases - key databases

According to the Official Statistics Act (2001:99) that came into force in April 2001, it is possible, for research and statistics purposes, to give out data with a serial number, which can be linked to a personal registration or organisation number using a code at the authority responsible for the statistics. Such information can be given out if the receiver has a specific need to add supplementary material later, such as the next year's information.

This issuing of unidentifiable material with a code means that the information, according to the Personal Data Act, will be considered as personal information for the receiver. The receiver then becomes responsible for the personal information and must follow the rules in the Personal Data Act.

10.3 Inquiries

A written request for the information required should be sent to the contact person at Statistics Sweden. When the information is to be used for research, Statistics Sweden would like to see a project description attached. If the research project has been tested by an ethics committee, the application and decision should also be attached. In cases where the information can be given out, Statistics Sweden will specify the delivery conditions, quality of the information and give a price offer.

I serien Bakgrundsfakta presenteras bakgrundsmaterial till den statistik och de prognoser som avdelningen för befolknings- och välfärdsstatistik vid SCB producerar. Det kan röra sig om produktbeskrivningar, metodredovisningar samt olika sammanställningar som kan ge en överblick och underlätta användandet av statistiken.

**Utgivna publikationer från 2001 i serien
Bakgrundsfakta till befolknings- och välfärdsstatistik**

2001:1	Hälsoindex	2003:4	BV-avdelningens Utvecklingsplan 2003
2001:2	The role of official statistics in a democratic society: statistics as an investment-free for users	2003:5	Flergenerationsregistret 2002, En beskrivning av innehåll och kvalitet
2001:3	Co-operations project "Population Statistics"	2003:5.1	Multi-Generation Register 2002, A description of contents and quality
2001:4	Uppdatering av immigrationsuppgifter med anpassning till den nya RTB-strukturen	2003:6	Barns hälsa – Förslag till utbyggnad av SCB:s årliga statistik om Barn och deras familjer
2001:5	Flergenerationsregistret – The Multi-Generation Register	2003:7	Översyn av Outhyrda lägenheter i flerbostadshus 2002 - 2003-09-12
2001:6	Utredning om komplettering och utvidgning av Flergenerationsregistret	2003:8	Studie av bortfallet i 2000-års undersökning av levnadsförhållanden (ULF)
2001:7	Konferens om välfärdsstatistik den 27 mars 2001	2003:9	Alternativa datainsamlingsmetoder för ULF
2002:1	Komplettering av Flergenerationsregistret – resultat från provregistrering av personakter över avlidna 1947 – 1967	2003:10	Slutrapport från projektet för översyn av produktionssystemet för framställning av tabeller till publikationer
2002:2	Ett nytt system för Register över totalbefolkningen. Bättre kvalitet och nya möjligheter – A new population register system. Better quality and new possibilities.	2003:11	Ensamstående och sammanboende i folkbokföringen, taxeringen och i verkligheten
2002:3	Slutrapport: Översyn av SCB:s Intäkts- och kostandsundersökning för flerbostadshus. Bilaga: Minnesanteckningar från programmet boende. Byggande och bebyggelse om IKU den 22 maj 2001.	2004:1	Örestat II, Utvidgad och integrerad flyttningsstatistik, Förstudie
2002:4	Befolkingens boende – idé till årlig sammanställning över nationell och internationell boendestatistik	2004:2	Frågebank över bakgrundsfrågor i postenkätundersökningar
2002:5	Översyn av SCB:s Bostads- och Hyresundersökning (BHU)	2004:3	Samordning av BHU-H och HEK – Samordning 2003
